1. (Currently Amended) A unified memory architecture that decouples a color buffer from a main memory in a computer, the architecture comprising:

AMENDMENT AND RESPONSE TO OFFICE ACTION

a <u>sole</u> memory controller connected to the main memory to manage use of the main memory between a graphics subsystem and a processing unit, the memory controller operable for partitioning an address space for the color buffer in main memory into two logical buffers, operable for designating one logical buffer as a frame-preparation memory and one logical buffer as a refresh memory, operable for connecting the frame-preparation memory to the graphics subsystem and operable for connecting the refresh memory to a display device, wherein color data is written into the frame-preparation
